Safety Regulations

The assembly, start-up and maintenance may be done by trained personnel only. Mains connection must be realized according to DIN VDE 0100. An equipment for protection and safety to release the power supply must be foreseen. The unit is conform to protection class I and protection system IP20, the operation is only allowed in cabinets or in closed electrical branches! No components to be maintained by the user are integrated in the unit. The unit may only be opened by qualified personnel. In case of failure we recommend to send the unit back to the manufacturer .

The disregard of the safety regulations may cause perilous injuries. In case of exceeding the values given in the technical Data, the risk of damage of the unit occurs.

• The operation instruction must be read carefully before use respectively installation of the unit, the general information must be followed.

The disregard may cause the loss of all guarantee and warranty claims!

- The installation, start-up and maintenance may only be done by trained personnel!
- The valid VDE-regulations, especially DIN VDE 0100 and EN 60204 are to be respected! The protective conductor must be connected (protective class I) Supply and outgoing feeder must be calculated and fused in a sufficient way (values look at point 3.1)! To release the power supply a separator for the mains and the battery circuit must be foreseen.
- The unit is a built-in device. The operation is allowed only in dry rooms.
- The allowed environmental temperature range is to be respected!
- Only the battery types specified for the unit are permitted to be used!
- Battery replacement is only to be made with the unit unpowered.
- In case of external buffer batteries the user must realize the battery fusing! The fusing element (overload and shortcircuit protection) must be installed as near as possible to the battery set because of safety reasons!
- On the usage of batteries, sufficient air flow in accordance with VDE 0510, part 2 must be ensured.
- Never connect together new and used batteries, or batteries of different types, or from different manufacturers
- The unit may only be opened by qualified personnel
 In appendix for the unit back
- In case of failure we recommend to send the unit back to the manufacturer.

The disregard of the safety regulations may cause perilous injuries!

1. Short-description

The battery backed up DC power supply in the **AKKU***TEC* range uses the standby-parallel principle of operation and, in conjunction with a lead accumulator, ensures that the DC power supply is reliably maintained in the case of a mains power failure. The back-up time depends on the state of charge of the battery and the discharge current. The power supply has the following features:

- battery charger system with I/U charging characteristic
- Micro-controller-based battery management

Temperature compensation for charging voltage by means of external sensor module (optional module).

		level: 24V DC (6-45 V DC)

4. Montage

The DC power supply must be build in in the way that the necessary cooling is guaranteed. A minimum distance from the cooling vents to neighbouring devices of \geq 40mm must be observed. The device must be built in in the way that sufficient air circulation is ensured. The specified environmental temperature must not be exceeded. The max mounting height without power derating is 1000m above NN. During the installation the unit must be covered when drilling chips may fall on respectively into the unit. (danger of short-circuit!)

5. Connection

Before connecting the values of mains voltage, frequency and the battery must be compared with the values on the type plate. Connection according to the designation of the connection terminals. (look at circuit diagramm and terminal asignment).

connection:	terminal:
mains connection	terminal connection 'mains' L, N, PE
DC-output (load)	terminal connection 'Ua'
	+, -
Pb-battery	terminal connection 'Batt' +, -
battery- temperature	terminal connection 'IO-
sensor	1' 1, 2
(optional module)	

connection:	terminal:
control input Shut-	terminal connection 'IO-
Down	1'3 + /4 -
mains OK	'IO-1'
mains present	6 / 7 (closed)
mains interruption	5 / 7 (closed)
Batt OK	8 / 9 (closed)
	. ,

In the case of overload, the DC output current comprises the maximum charging rectifier current as well as the current from the battery. To prevent overload of the DC output circuit, the circuit is to be protected externally ! (Value see Section 3.1)

7. Putting into operation

The unit is switched on by the application of the mains supply.

If the unit is built into systems, in which over voltages are required for the check (for example according to EN60204-1 / VDE0113 part1 19.4 voltage control), the unit must be separated from the test assembly before the voltage is switched on. (Original text EN60204-1 : components, which are not dimensioned for the testing voltage must be separated during the testing.)	
The battery voltage must match the nominal voltage of the AKKUTEC! Never reverse the poles of the battery! Never short circuit batteries! Risk of arc! Check the connections for correctness prior to switching on for the first time Only make electrical connections with the unit un-energized	

8. Operation

Approx. 2s after the switch on of the mains, the output voltage is released and the loads which are connected are supplied with power. The back up battery is also charged. This operating mode is indicated by the illumination of the green 'Netzbetrieb' (Mains Operation) LED.

By removing the mains voltage, or if the input voltage drops below the minimum, the **AKKU***TEC* switches over to battery mode. The 'Netzbetrieb' (Mains Operation) LED is <u>not</u> illuminated in this case.

The illumination of an LED always results in the energysation of the corresponding signal relay. (See block diagram, point 6)

9.1 Control of battery circuit

To check the capability of the UPS to provide back up, the battery circuit is tested cyclically at intervals of 60s; the first test is performed 60s after mains switch on. By means of this test it is possible to identify an open circuit or the high resistivity of the battery circuit. A defective battery circuit is indicated by the expiry of the 'Batt ok' LED

9.2 Battery test

During mains operation, a cyclic battery test loads the battery whilst the voltage is measured. In this way it is possible to evaluate the quality of the battery. A seriously aged battery is indicated by the expiry of the LED "Batt. OK". About one hour of switching on the mains the first battery test is effected, each other after 24 hours.

By the processor controlled, automatic battery test the back-up capability of the battery is ensured.

To get detailed information concerning the capacity of the batteries in the present system, we suggest the control the batteries with the nominal load current at least one time each year. To realize this, battery operation must be enforced by mains switch-off and the back-up time until the automatic switch-off because of the deep-discharge protection must be measured. The effective battery capacity can be calculated from the back-up time and the nominal load. If the battery capacity should not be sufficient, the batteries must be changed.

The battery test is used to detect <u>seriously</u> aged batteries. To evaluate the backup capacity of the batteries with this system, it is imperative that a manual battery check is performed from time to time! (See point 11)

9.3 Shut-Down

To avoid the discharge of the battery until the deep discharge limitation, it is possible to abandon the battery operation with an external signal. This is effected by connecting a +24V DC control voltage at terminal 3 (+) and 4 (-) at the terminal strip 'IO'.

Adresse: Helmholtzstrasse 13 D-77652 Offenburg Postfach 2327 D-77613 Offenburg

Tel. +49/(0)781/206-0 Fax +49/(0)781/25318 www.j-schneider.de info@j-schneider.de 7/10

Geschäftsführer: Bettina Schneider Dipl.Betriebswirt (BA) Rolf Anti Dipl.-Wirt.-Ing.(FH) Amtsgericht Freiburng HRB 470758

9.4 Temperature compensation (optional modul)

Lead batteries have a temperature coefficient of approx. -3mV per °C and cell. The **AKKU***TEC* final charging voltage is selected such that battery charging is provided over a temperature range of 15-45°C.

In applications with frequent and large temperature variations, the charging voltage should be appropriately compensated to achieve optimal battery life. Also, particularly in the case of very low environmental temperature (Tu < 15 °C), compensation should be performed to ensure adequate battery charging.

By connecting the external temperature sensor module (option) to terminal strip 'IO-1' connection 1 and 2 (note poles!), temperature compensation is automatically activated. For an surrounding air temperature variation of 0-45 °C, the final charging voltage (and thus also the output voltage) varies over a range of 27.85 - 26.3 V DC

Battery temperatures above 45 °C are indicated by the expiring of the LED 'Batt OK'

To obtain satisfactory battery life, the operating temperature of the batteries should not exceed 25 °C. Higher temperatures lead to a reduction in the lifetime!

10. Taking out of operation

The unit is taken out of operation by removing the mains supply. To prevent subsequent backup from the batteries, the battery circuit must be opened by activating 'Shut-Down'. (See Section 9.3). The LEDs 'Netz OK' and 'Batt OK' must expire. (s. Punkt 9.3).

Never undo electrical connections whilst the unit is in operation! It also not permitted to make electrical connections whilst the unit is in operation!

12. Maintenance

Inside the unit there are no parts which may be maintained by the user. The unit is to be cleaned regularly, depending on the degree of soiling. The batteries must be checked as described in section 9.2 and must eventually be exchanged.

Operational instruction Temperature-sensor AKKUTEC 2402

MTIA – Q33G3M01

- The operation instruction must be read carefully before use respectively installation of the unit, the general information must be followed.
- The disregard may cause the loss of all guarantee and warranty claims!
- The installation, start-up and maintenance may only be done by trained personnel!
- The unit is a built-in device. The operation is allowed only in dry rooms.
- The connection or disconnection of electrical connection must only be realized in voltage-free state
- The unit may only be opened by qualified personnel
- In case of failure we recommend to send the unit back to the manufacturer.

Short description

Lead batteries have a temperature coefficient of approximately -3mV per °C and cell in case of parallel operation. The final charging voltage is selected in such a way that the charge of the battery in a temperature range of 15-45 °C is ensured. In case of applications with often and strong temperature variations the charging voltage should be tracked to avoid a battery overcharging (danger of gas). In case of very low temperatures (Tu<15 °C) a voltage tracking ensures sufficient charge of the batteries.

With the connection of the temperature sensor at the terminal strip 'IO-1' connection 1 and 2 the temperature tracking is automatically activated. Corresponding to the fluctuations of the environmental temperature of 0-45 °C the final charging voltage (as well as the output voltage) alternates in a range of 27,85 - 26,3 V DC. Battery temperatures above 45 °C are indicated by the expiring of the "Batt OK" LED.

Scope of delivery Temperature sensor with 1m connection cable 0,5 mm² Nylon-cable clip with 4,3 mm bore hole

Adresse: Helmholtzstrasse 13 D-77652 Offenburg Postfach 2327 D-77613 Offenburg

Tel. +49/(0)781/206-0 Fax +49/(0)781/25318 www.j-schneider.de info@j-schneider.de 11/10

Geschäftsführer: Bettina Schneider Dipl.Betriebswirt (BA) Rolf Anti Dipl.-Wirt.-Ing.(FH) Amtsgericht Freiburng HRB 470758

The battery sensor should be installed near by the battery, as shown in the example of the battery module NBBH 2402 (look at picture). So the exact measurement of the environmental temperature of the battery is ensured.

Connection

The temperature sensor is connected at terminal 'IO-1' connection 1 and 2 of the AKKUTEC 2402. The polarization of the connection cable is variable. A maximum cable length of 3 m must be foreseen. The diameter of the cable should amount at least to 0,5mm².

Putting into operation

The temperature sensor is recognized automatically from the AKKUTEC after the connection to the mains and the charging voltage is automatically tracked according to the temperature. An additional parameterisation is not necessary.
