

## ■ Analog Input Modules

### Detection of analog process signals

The analog input modules convert analog process signals, for example pressure, flow or fill level, linearly into digital values, which are further processed by the Q CPU.

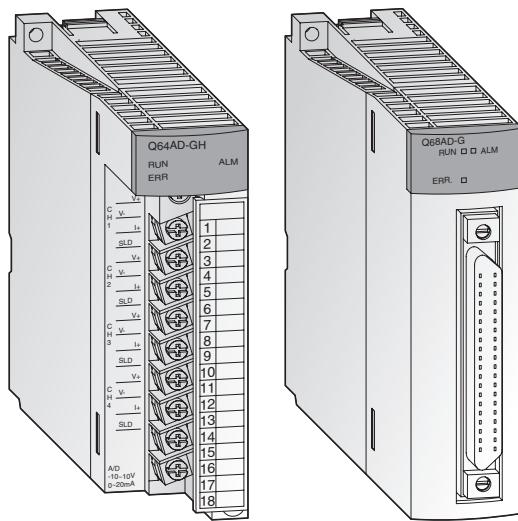

### Special features:

- Up to 8 channels per module (Q68AD□) and up to 256 channels per system (Q CPU)
- Resolution of 0.83 mV and 3.33 µA (Q64AD)
- Conversion time of 80 µs/channel (Q68AD□)
- Calculation of average value over the time or measurement cycles can be configured
- Integrated logging function (Q64ADH)
- Flow amount measurement function (Q64ADH)
- Potential isolation between process and control by means of an optocoupler is a standard feature.
- All modules are provided with a removable terminal block fastened with screws..

## ■ Analog Input Modules

### Channel isolated and high resolution

The analog input modules convert analog process signals into digital values with high accuracy. With the exception of the ME1AD8HAI-Q, all channels are isolated between each other and against the external power supply with high dielectric withstand voltage for both.

The ME1AD8HAI-Q provides a HART master function and can communicate with up to eight HART-enabled devices. The connection of standard analog input devices is also supported.

### Special features:

- Potential isolation between each channel and between process and control is a standard feature.
- High resolution: 16/32 bit signed binary
- High accuracy with a reference accuracy of  $\pm 0.05\%$  and a temperature coefficient of  $\pm 71.4 \text{ ppm}/^\circ\text{C}$
- Integrated short circuit protection by limiting the input current
- Signal conditioning function for the Q62AD-DGH
- Q66AD-DG signal converter
- Power supply for 2-wire transmitter (Q66AD-GD, ME1AD8HAI-Q)
- A primary delay filter smoothes out the line of digital output values by a user-defined time constant
- Terminal block is fastened with screws and removable.
